

ENDURANCE™ is a new plant growth regulator designed to impact yield and quality in specialty crops by increasing fruit set and fruit retention. Applying ENDURANCE just before the transition from vegetative growth to reproductive growth, increases photosynthesis and stimulates biological systems which help a crop overcome stress events that result in early fruit abortion. Years of trial work has shown that ENDURANCE consistently helps set and retain more fruit in many specialty and permanent crops.

Grower Benefits

- Helps the crop set more fruit during early reproductive stages
- Promotes retention of fruit and takes advantage of an aggressive fertility program
- Increases photosynthesis and stimulates major plant detoxification systems for a more vigorous crop that can overcome the stresses of the season
- Compatible with many fertilizers and pesticide tank-mix partners
